

MOVIE INDUSTRY ANALYTICAL REPORT

Introduction/Background

These findings are based on the Kaggle Movie Industry dataset, which consists of 6,820 movies from 1980 to 2020. All data was scraped from IMDb.

Findings

The findings can be categorized into two groups: Information and Money.

Movie Information

Information includes general details about the movie industry throughout time, such as genres and ratings. First, there are five major movie genres: Action, Adventure, Biography, Comedy, Crime, and Drama. Biographies have experienced the most significant growth in prevalence over time, while comedies have been steadily decreasing. Certain genres have peaks, such as Crime movies increasing in the 90s (visual 1). Additionally, certain genres are more prevalent during specific months. Comedies are typically released in April and August, while Dramas Are Released in January and October. There is a slight increase in Horror films during colder months (visual 2). There are also some genres that typically perform better than others with audience scores, including Animation films and Biographies on average (visual 3). Lastly, there is no consistent relationship between the percentage of movies rated for adults increasing over time (dashboard visual 1). Interestingly, the top-grossing movie's genre for each decade was: Family (80s), Drama (90s), and Action (2000s through 2020s) (dashboard visual 2).

Money & Revenue

Money includes key findings about revenue and grossing in the movie industry throughout time. First, the top three movie production companies are Universal Pictures, Warner Bros., and Twentieth Century Fox, as they produced the most revenue over time (visual 4). Universal Pictures and Warner Bros. have both had their revenue increase steadily over time (with peaks during certain years). While Twentieth Century Fox has remained consistent, but produced some high revenue movies during certain years, bringing up their overall average (visual 5). Lastly, the movies with the most revenue per decade have been: E.T. (\$782,410,554), Titanic (\$2,001,647,264), Avatar (\$2,610,246,203), Avengers: Endgame (\$2,441,501,328), and The Eight Hundred (\$381,421,559).

Recommendations

These findings offer valuable insights into popular movie genres, production companies, and the evolution of the movie industry over time. While these findings may be interesting to any moviegoer, they could also inform decision-making for movie production companies. For instance, producing Animation films and Biographies typically have higher averages. This could be because those audiences are more inclined to write reviews, or because of the moving/inspirational nature of those movies. Another key takeaway is that Action movies are becoming increasingly popular and have consistently generated the most revenue over the last

three decades. This may be because of the popularity of the Marvel Cinematic Universe. Lastly, there have been significant changes in the movie industry due to the rise of streaming services. Companies such as Netflix and HBO Max may want to purchase the rights to the movies produced by Universal Pictures and Warner Bros. since their films consistently generate a lot of revenue.

Summary

In summary, a great deal has changed over the last four decades, including our preferences in movies. These findings could be insightful for anyone considering investing in production companies or for companies seeking to produce new films. However, these results are also interesting to the average person who enjoys a good film.
