

To create this dashboard, I had to load multiple libraries, including:

- readr, stringr, and scales for formatting
- dplyr for cleaning
- ggplot2, shinydashboard, and shiny for the visuals
- paletteer for colors

After uploading the necessary libraries, I uploaded my transformed data from the 6 visuals I had previously made. Even though the data was clean, I still had to make sure that the rating and genre columns were formatted properly (string and factor). I then created a decade column (using my previous code) and grouped ratings by adult_flag for the first visual. Using this updated dataset, I was able to build my visual.

To build the dashboard itself, I use the Shiny website for formatting. I made my dashboard red, included a sidebar, and added two boxes in a row format. In the sidebar, I included my filtering inputs: a checkbox for genre, an input for year, and a dropdown for decade. In the actual dashboard body, I put my line chart and bar chart.

After making the dashboard, all that was left was my server. I updated my code from the Diamonds assignment to ensure that the visuals update based on the user's inputs. I then crafted my two plots, which were pretty straightforward as I had already made a lot of plots for this dataset.

The first plot shows the percentage of movies falling under each rating over the years. I was interested in seeing whether the number of adult-rated films produced over time increased. The second plot shows a bar chart (flipped) of the top ten grossing movies by decade. This visual presents a more detailed view of plot 6 from the assignment, which was a faceted scatter plot.

In the dashboard, the user can filter by movie genre (all options), select a year range, and choose a decade. Additionally, both visuals are color-coded (the first is adult vs. non-adult and the second is genre). This interactivity allows users to learn more about the movie industry from 1980 to 2020 in the way they would like to, which I think is pretty cool.

Overall, the dashboard is designed to help viewers understand how the movie industry has evolved over the years. From producing adult-rated movies, to which movies/genres brought in the most money. I think it's interesting to look at these trends as I am a moviegoer myself.
